## 1 General information

The product range of Bucher Hydraulics SpA includes single pumps 05-100-212-212HP-250HP-300-312HP (corresponding with the common group denominations: 05-1-2-2.5-3) and several combinations of double pumps, triple pumps, and so on, that can be assembled together according to

versions of displacement, flanging, and auxiliary valves. External gear pumps are widely used in modern hydraulic systems due to their high performance, long service life and low purchase and maintenance costs.

Here following we introduce you the AP300 family range.

Bucher Hydraulics has so achieved these results by constantly improving its design, control and manufacturing techniques inline with the latest technological developments, while simultaneously enhancing our Quality

Control System which ensures that every single product offers the same high standards.

## 1.1 AP300 single pump technical data

Features		
Fluid temperature range (mineral oil)	NBR	-15 / +80 °C (peak: -20 / +90 °C)
Recommended fluids		hydraulic mineral oil-based
Viscosity range:	Recommended Permitted Permitted for starting	20-120 mm <sup>2</sup> /s (cSt) up to 700 mm <sup>2</sup> /s (cSt) 2000 mm <sup>2</sup> /s (cSt)
Cleanliness:	recommended up to 140 bar (2000 PSI) recommended up to 210 bar (3000 PSI) recommended up to 275 bar (4000 PSI)	20/18/15 ISO 4406 19/17/14 ISO 4406 17/15/12 ISO 4406
Minimum storage temperature:	NBR	-25 °C
Standard seals material (valves not included)		NBR

## 1.2 Operating limits

AP300 Type	Displacement		Max. Pressure*						n min.		n max.

\* Referred to pumps with flanged ports. Utilising threaded ports, please to consider a significantly de-rated performances.

The mechanical stress localised on threaded ports cause a reduced pump life performances

Important: Please contact our Sales Department if even one of the operating limits indicated in the tables below (temperature, pressure, rpm) is exceeded, as well as in the case of two or more maximum values at the same time, or for applications with particularly heavy-duty cycles.

## 1.3 Pressure

Pressure levels:

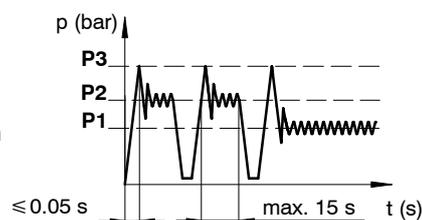

P1 = continuous pressure

P2 = intermittent pressure

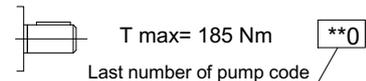

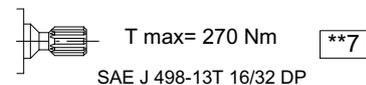

P3 = peak pressure

The recommended oil speed in the pressure pipes is:

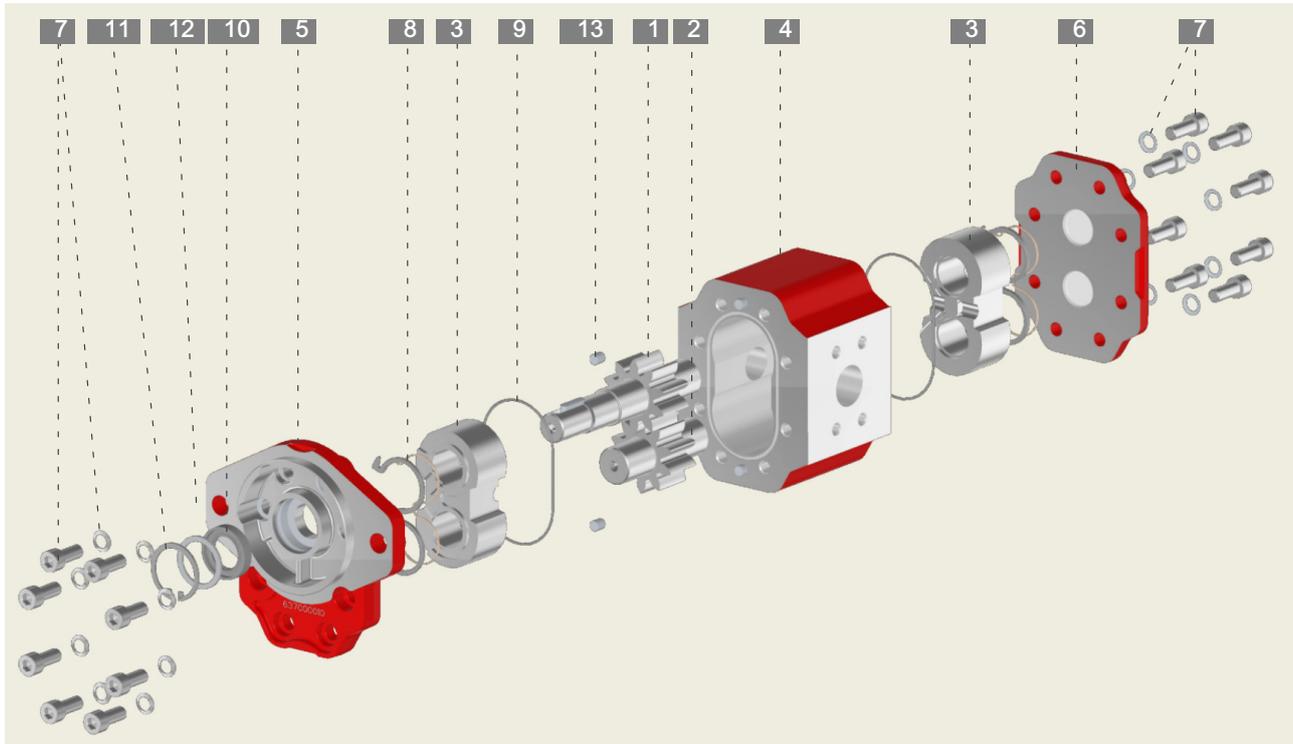

v = 2 to 5 m/s

Max torque allowed to the shaft

## 1.4 Product description

1. Drive gear
2. Driven gear
3. Balancing
4. Pump body
5. Front cover
6. Rear cover
7. Fixing screw and washer

8. Balancing seal
9. Oil seal
10. Shaft seal
11. Retaining ring
12. Seger
13. Centering pin

Referring to the pump shown in the figure, the drive gear (1) drives round the driven gear (2), transferring the oil from the suction port to the pressure port as it turns round.

The gears are made from high strength steel alloy.

The bushings (3) serve a dual purpose:

- to act as a bearing for the gears
- to balance axial and radial thrust in proportion to the change in operating pressure.

The gears-bushings assembly is fitted inside the pump body (4), in which generally the suction and pressure ports are formed.

The pump body is made of high strength extruded aluminium alloy.

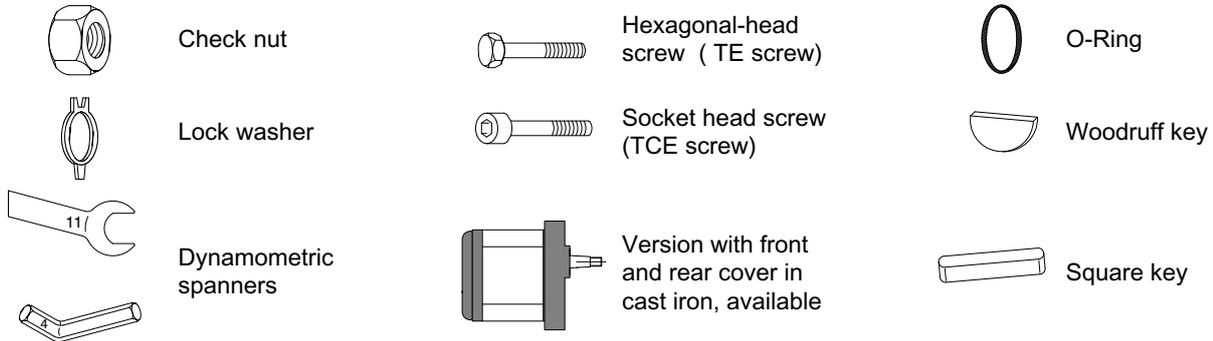

The front cover (5), which also acts as a mounting flange, and the rear cover (6) are connected to one another by fixing screw and wash (7).

The pump assembly is completed by a series of seals:

- Balancing seals (8) can be fitted in recesses in the bushings as shown in the figure, or in the covers. Their purpose is to delimit the longitudinal balancing area separating the suction and pressure zones.
- Oil seals (9) prevent oil from leaking out.
- An oil retaining ring with the dual purpose of preventing oil leaks from the drive gear shaft and preventing dust or other pollutants from entering the pump itself. Unless otherwise specified, the seals are in nitrilic compound offering high mechanical strength and heat resistance.
- Viton seals are available on request.

(see 1.7 Recommended fluids/Allowed temperatures).

## 1.5 Non-standard symbols used in the text

## 1.6 Identifying the rotation direction

The rotation direction of a gear pump is identified by looking at the pump from the front and with the drive gear turned upwards (see figures below).

Pumps with clockwise rotation (D) have a drive gear which turns clockwise, with the suction port on the left and the pressure port on the right.

Pumps with counterclockwise rotation (S) have a drive gear which turns counterclockwise, with the suction port on the right and the pressure port on the left.

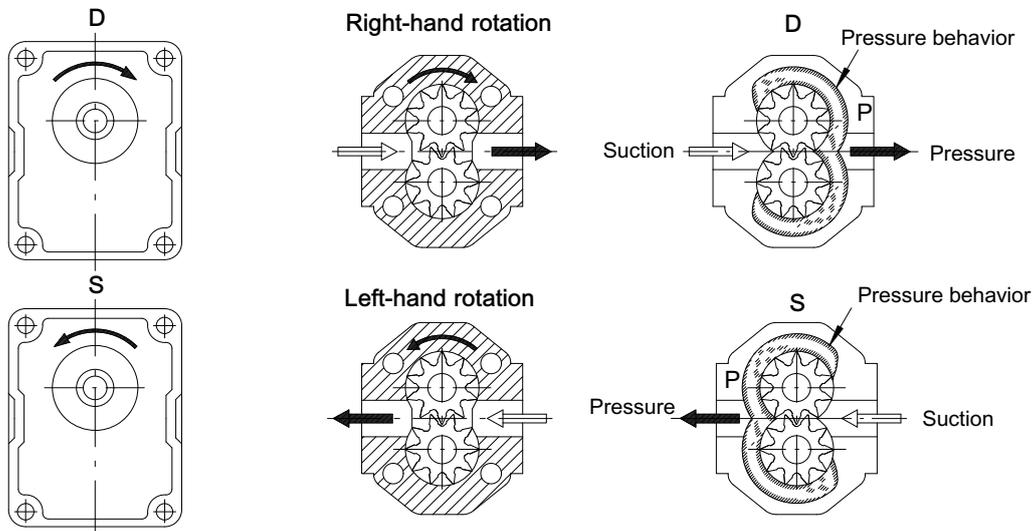

The figure also shows the pressure flow inside the pumps as the oil is transferred from the suction port to the pressure port.

Pumps with a unidirectional rotation (D or S) have the denomination AP.

It is possible to change the rotation direction of the entire range of pumps without having to replace any component, except for the AP100 group, for which it is necessary to replace the front cover.

To ensure a good technical result, we recommend in any case that such inversion be carried out at our factory.

Technical descriptions are available on request, which show the correct procedure for the pump rotation inversion.

## 1.7 Recommended fluids/Allowed temperatures

Bucher Hydraulics recommends to use a mineral based oil according to type HM (ISO 6743/4) or type HLP (DIN 51524) only.

: Use of pumps at temperatures above 80°C must always be agreed upon with our Technical Office, and in any case this can cause a significant worsening in the volumetric efficiency. For use under conditions different from those indicated in this catalogue, please contact our Sales Department

## 1.8 Suction

The absolute suction pressure must be  $P_{in} \geq 0.75$  bar (11 PSI); therefore, the following must be avoided:

- large height differences between pump and tank
- long stretches of piping
- special features such as:
  - bends
  - reductions in diameter
  - quick couplings
  - etc.

It is also advisable to choose a filter of a suitable size to minimise any pressure drop and to take measures to prevent gradual clogging over time.

(Example 1)

In certain cases, the suction pressure can exceed 1 bar (14.3 PSI), or atmospheric pressure.

Please contact our Sales Department, solution for  $P_{in} \leq 3.5$  bar (50 PSI), are available.

If in a particular application the  $P_{in}$  pressure is higher than the recommended value, contact our Sales Office.

The diameter of the suction pipe should ensure that the oil speed will fall within the range:  $v = 0.6 - 1.2$  m/s.

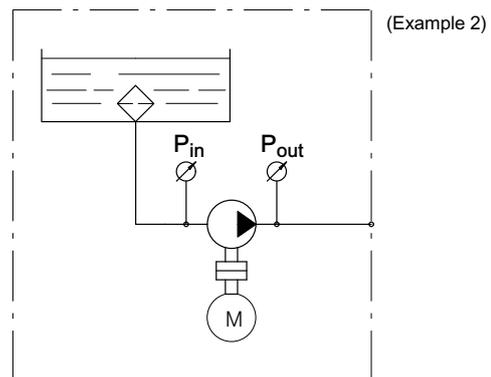

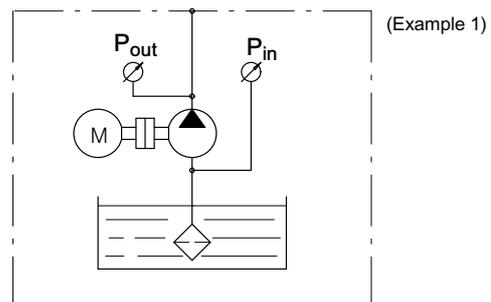

(Example 2)

## 1.9 Filtration

A short service life of a gear pump is normally due to the presence of impurities in the oil.

It is therefore essential to have an effective filter in the system and to carry out regular maintenance to ensure a long, trouble-free service life.

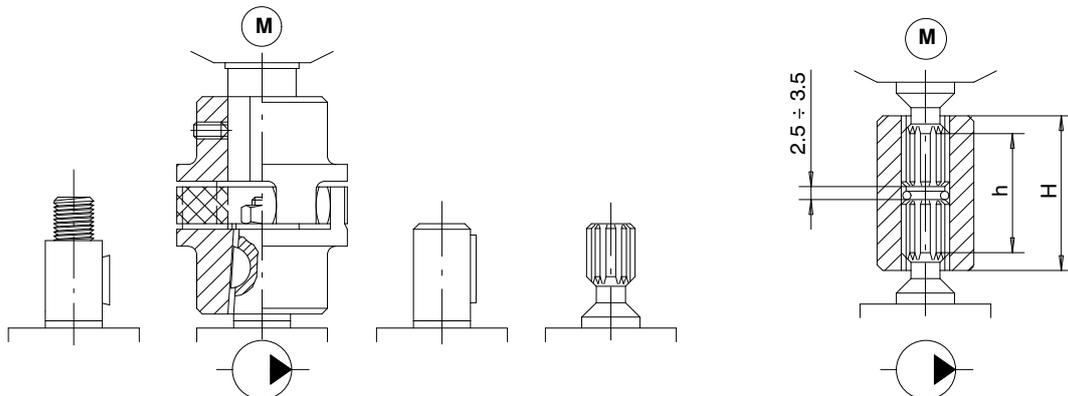

When possible and compatible with the hydraulic circuit installed, Bucher Hydraulics S.p.A. recommends that the system have total filtration (suction, pressure, return).

In any case, the filtering system must constantly ensure an oil contamination class equal to or less than those shown in the following table.

We also recommend that an adequate air filter be installed on the tank to prevent contaminating substances such as dust, sand, etc. from getting into the oil, as these substances can enter the tank through the air flow caused by the level variations in the tank itself.

## 1.10 Motor-pump coupling

Absolutely no radial or axial forces should be transmitted to the drive shaft in the motor-pump coupling.

Such forces cause rapid and irregular wear on the balancing surface of the bushings and gear support, with a consequent worsening in pump performance.

The coupling joint must be able to absorb any discrepancies in the coaxial alignment of the motor-pump shafts without placing any load on the pump shaft.

In the couplings between splined shafts, the connecting sleeve must be free to move along its axis.

The length of the sleeve must be sufficient to cover the splined sections of the motor-pump shafts completely in any position.

The distance between the ends of the shafts must be between  $2.5 \pm 3.5$  mm (.10"  $\pm$  .14").

Make sure that the splined coupling is suitably lubricated to protect it against rapid deterioration.

If there are radial and/or axial loads on the drive shaft, such as when it is driven by a V-belt and pulley or pair of gear wheels, it should be fitted with a front cover with supporting bearings.

## 1.11 General precaution

In addition to the recommendations regarding fluids, filtration, coupling, etc., we suggest the following:

- Always check the rotation direction of the pump's drive shaft; it must be compatible with the rotation direction of the pump itself.
- Be particularly careful in cleaning and make sure, when connecting the suction and pressure piping, that no chips, rag threads, teflon tape, etc. get into the pump circulation system.
- Check the tightness of the suction and pressure fittings, the correct positioning of the O-Ring, and make sure there is no dirt between the flange and the pump body.
- The first pump start-up can be facilitated by manually filling the suction piping and the pump itself with oil. To facilitate air bleeding, start the pump with the circuit not pressurised.

- To ensure the best heat distribution inside the tank, make sure the return pipe is not too close to the pump's suction piping. The pipings themselves should be below oil tank level to prevent the formation of foam.
- Do not subject the pumps to operating conditions different from those indicated in section 1.1; for extreme operations, always contact our Technical Department.
- Never use fluids different from those indicated in section 1.7.
- In the event of pump painting, do not use solvents or paints that are incompatible with the material of the seals. Do not bake paint with excessively high temperatures. Do not paint over the product identification plate; the warranty will not be valid if this plate is illegible.

### 1.11.1 Directives and standards

- Atex:

: The equipment and protective systems of this catalogue ARE NOT intended for use in potentially explosive atmospheres. Ref: Directive 99/92/EC and Directive 2014/34/UE

- ISO 9001:2015 / ISO 14001:2015

Bucher Hydraulics S.p.A. is certified for research, development and production of directional control valves, power units, gear pumps and motors, electro pumps, cartridge valves and integrated manifolds for hydraulic applications.

## 1.12 Pressure

Pressure levels:

P1 = continuous pressure

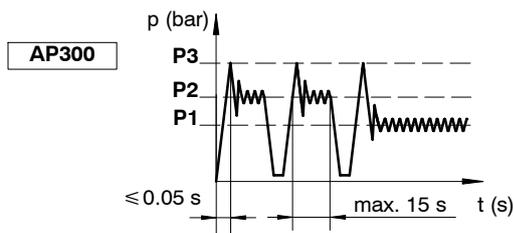

P2 = intermittent pressure

P3 = peak pressure

The recommended oil speed in the pressure pipes is:

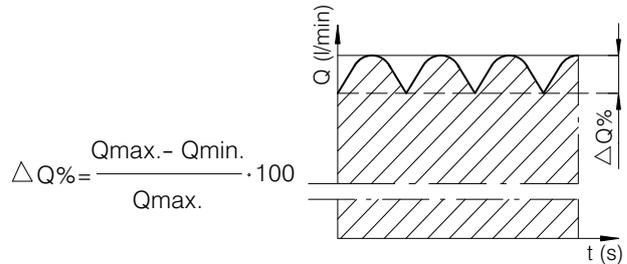

$v = 2 \text{ to } 5 \text{ m/s}$

The characteristic data of each pump is given in the tables on the following pages.

Pressure flow rate surging

Pump	z	$\Delta Q\%$
AP300	10	16

## 1.13 Calculating the specification of a gear pump

The following parameters are defined:

$V_c$  = (cm<sup>3</sup>/r) pump displacement;

$n$  = (r/min) no. of rpms of the drive shaft;

$Q$  = (l/min) flow rate;

$p$  = (bar) operating pressure;

$T$  = (Nm) drive torque;

$N$  = (kW) power;

$\eta_v$  = (%) volumetric efficiency;

$\eta_m$  = (%) mechanical efficiency;

$\eta_t$  = (%) total efficiency

$$Q = \frac{V_c \cdot n}{100000} \cdot \eta_v$$

$$T = 1.59 \cdot \frac{p \cdot V_c}{\eta_m}$$

$$N = \frac{Q \cdot p}{6.12 \cdot \eta_t}$$

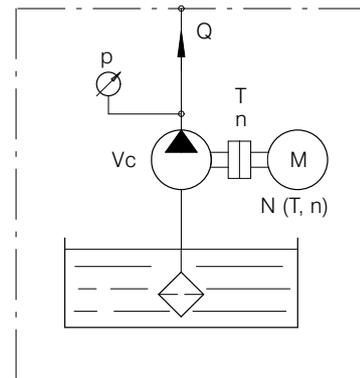

Example

AP300/45  $V_c = 11.1 \text{ cm}^3/\text{r}$   $n = 1500 \text{ r/min}$   $p = 200 \text{ bar}$   $\eta_v = 94\%$   $\eta_m = 90\%$   $\eta_t = 84.6\%$

$$Q = \frac{45 \cdot 1500}{100000} \cdot 94 = 63.45 \text{ l/min.}$$

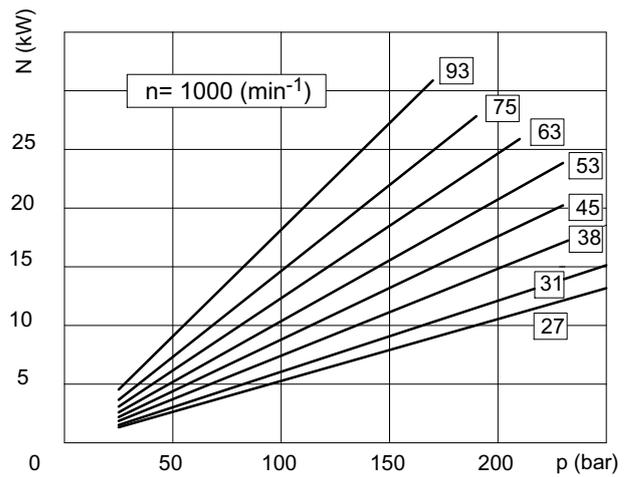

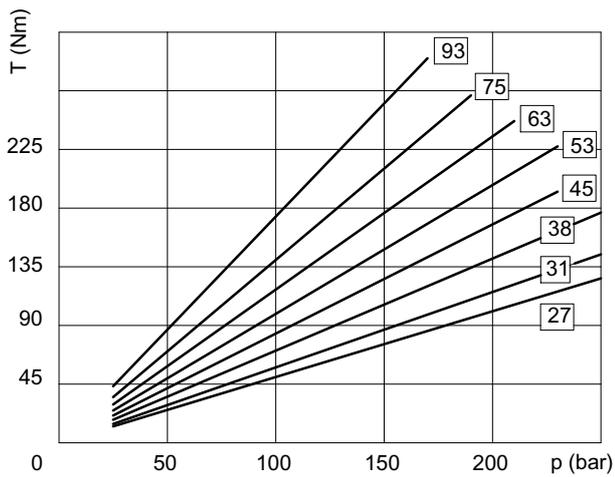

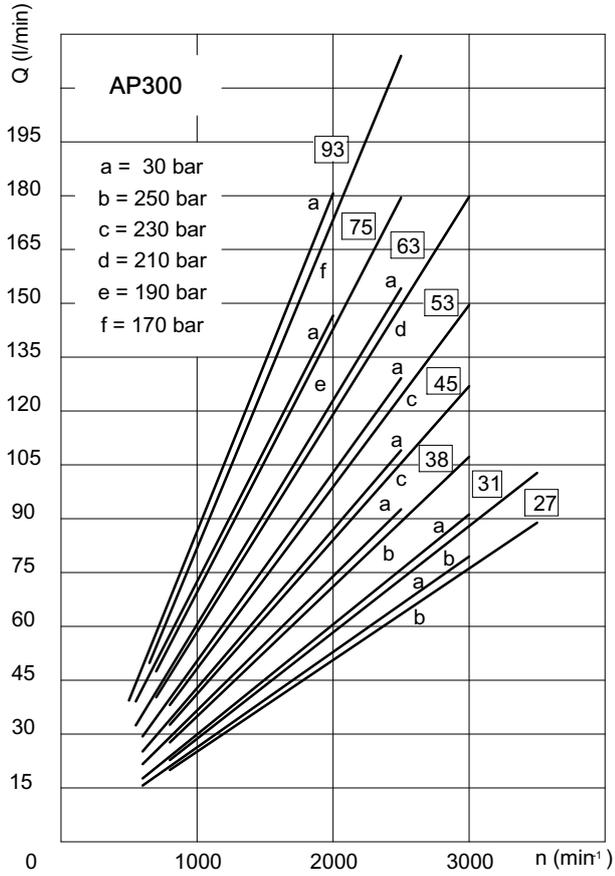

$$T = 1.59 \cdot \frac{200 \cdot 45}{90} = 159 \text{ Nm}$$

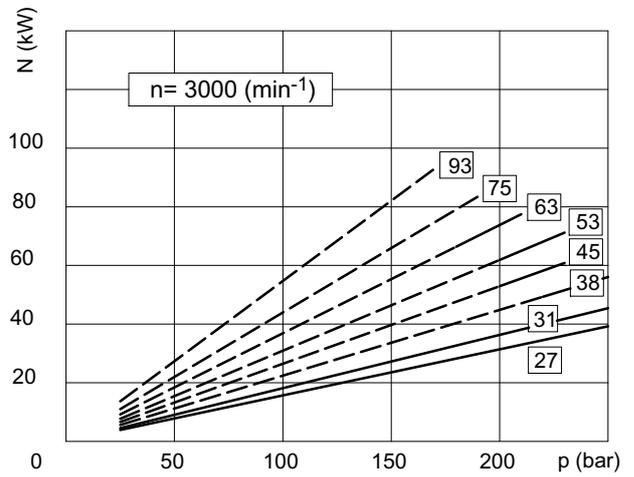

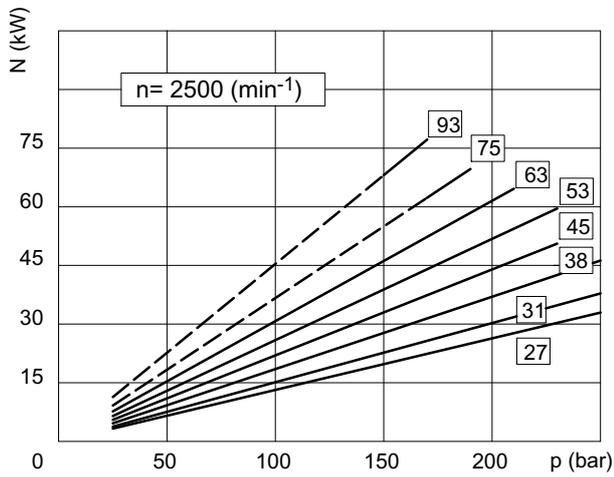

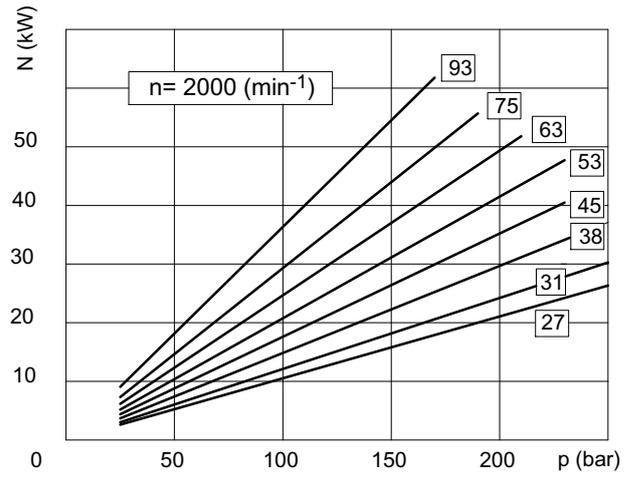

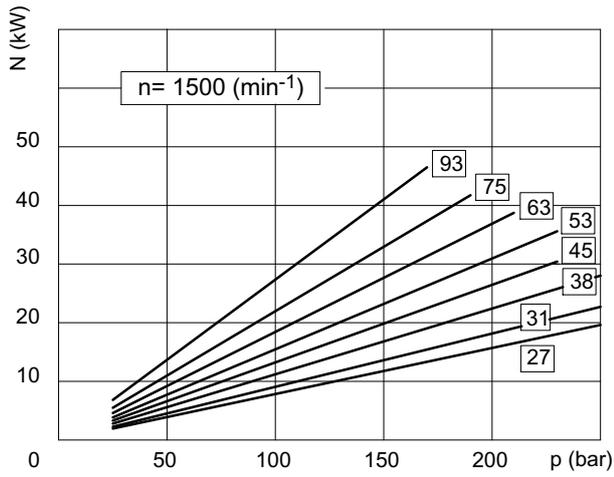

$$N = \frac{63.45 \cdot 200}{6 \cdot 84.6} = 25 \text{ kW}$$

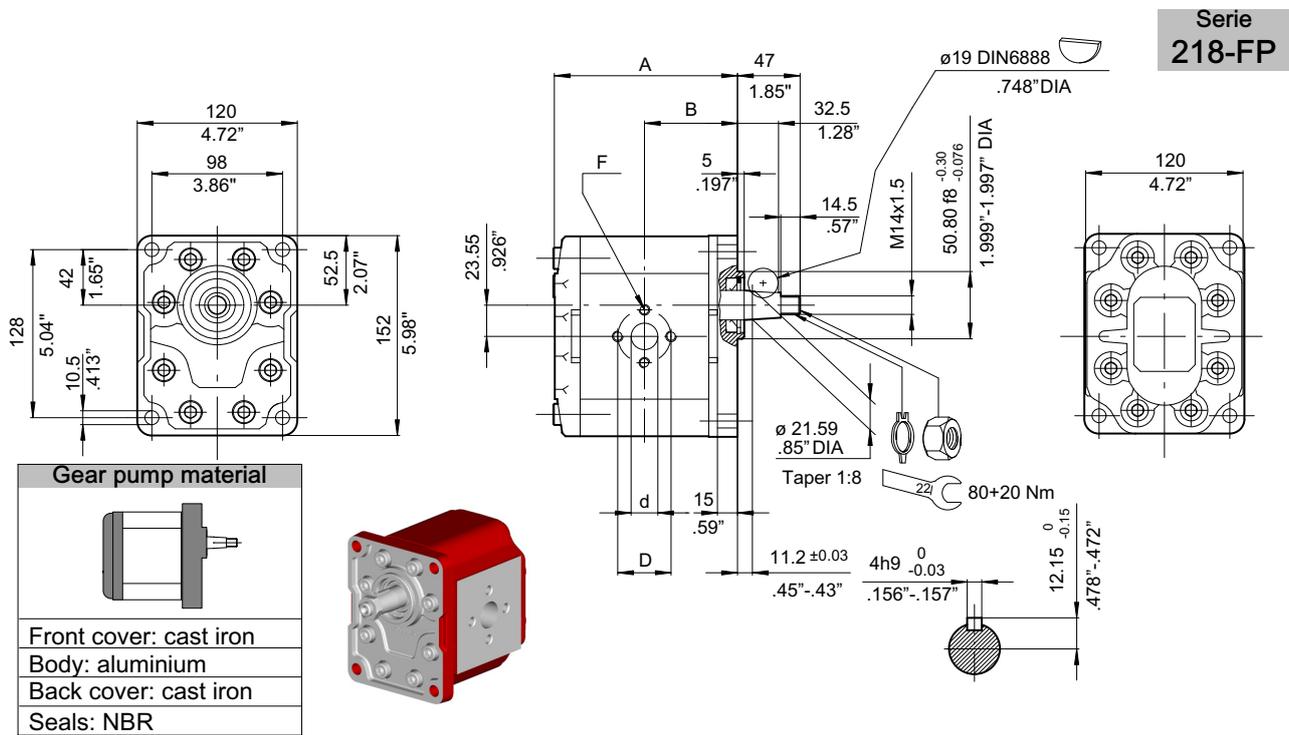

## 1.14 Diagrams

## 3 AP300 tandem pump

### 3.1 AP300 + AP300

Group AP300 + AP300  
Serie  
2218

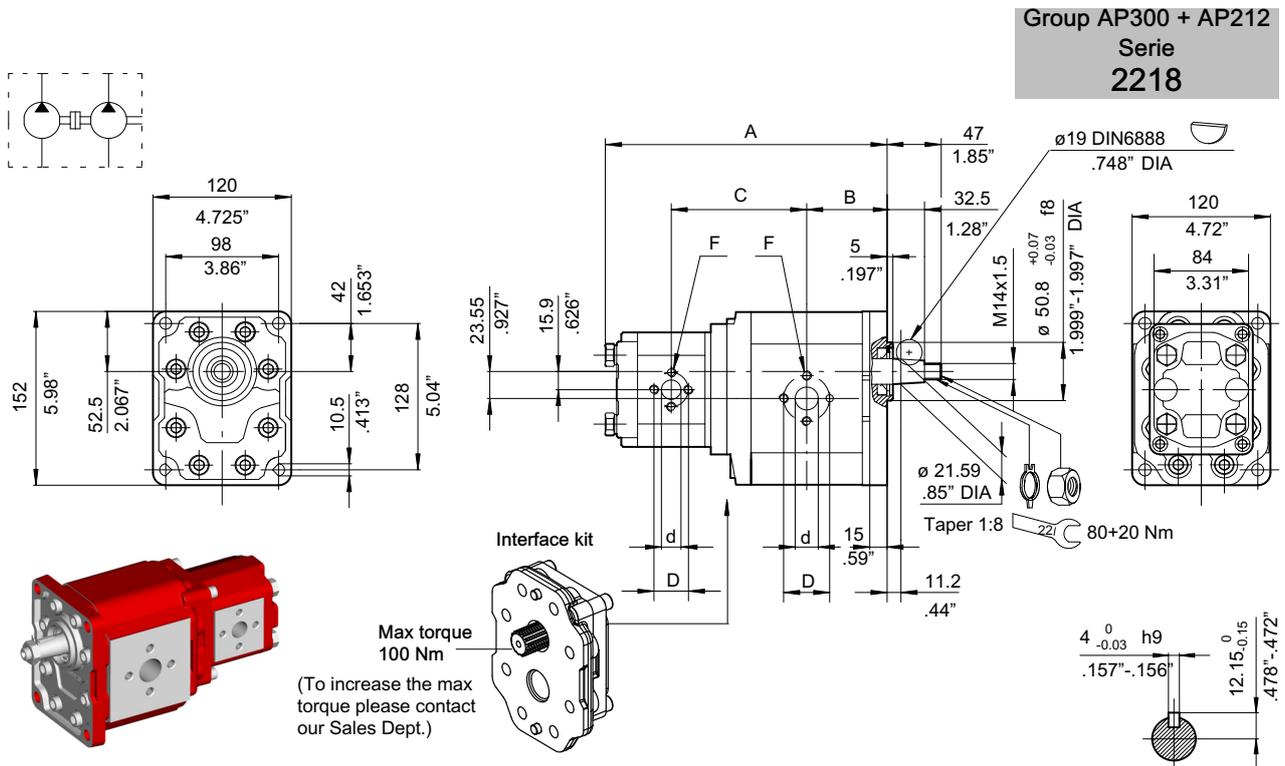

Note: With respect to the standards, the maximum pressures of some versions of this pump are reduced in relation to the max. torque allowed to the main and intermediate shafts.

Displacement cm <sup>3</sup> /rev	A		B		C

Example of product code

AP300/38 - 212/15 D 2218  
(Clockwise rotation: D)

AP300/63 - 212/22 S 2218  
(Counterclockwise rotation: S)

### 3.3 Pumps seal kit standard type

AP300 (NBR)	
Pump code	Seal kit
AP300/218 FP	200974000140
AP300/818 FP	
AP300/287S FP	200974000170
AP300/280 FP	

AP300+AP300 (NBR)	
Pump code	Seal kit
AP300/2218 FP	200974000150
AP300/2280-7S FP	200974000160

AP300 (NBR) + AP212 (HNBR)	
Pump code	Seal kit
AP300/2218 FP MP	200974001650
AP300/2218 FP MPS	200974001660
AP300/2287 FP MP	200974001670
AP300/2287 FP MPS	200974001680

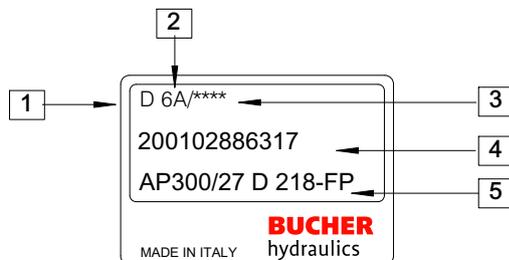

This code are referred to Dealer code only (version MP and MPS)

### 3.4 Single pump weight

AP300	
Pump	Weight Kg
AP300/27	8.2
AP300/31	8.4
AP300/38	8.6
AP300/45	8.8
AP300/53	9.0
AP300/63	9.2
AP300/75	9.4
AP300/93	9.6

N.B.: The weight refers to pumps with version serie 218 .  
Limited weight variations are possible for pumps having a different code.

## 4 Product identification plate

- 1 : Rotation  
(D= Clockwise rotation - S= Counterclockwise rotation)
- 2 : Manufacturing year and month
- 3 : Progressive identification no. (optional)
- 4 : Bucher Hydraulics S.p.A. product code
- 5 : Description

Manufacturing month	Manufacturing year					
	2016	2017	2018	2019	2020	2021
January	6A	7A	8M	9M	0M	1M
February	6B	7B	8N	9N	0N	1N
March	6C	7C	8P	9P	0P	1P
April	6D	7D	8Q	9Q	0Q	1Q
May	6E	7E	8R	9R	0R	1R
June	6F	7F	8S	9S	0S	1S
July	6G	7G	8T	9T	0T	1T
August	6H	7H	8U	9U	0U	1U
September	6I	7I	8V	9V	0V	1V
October	6J	7J	8Z	9Z	0Z	1Z
November	6K	7K	8X	9X	0X	1X
December	6L	7L	8Y	9Y	0Y	1Y

### 5 Application form

Date:
